### **The Speed of Firm Response to Inflation**

Ivan Yotzov, Nicholas Bloom, Philip Bunn, Paul Mizen, Gregory Thwaites

1-2 October 2024 BoC-ECB-NY Fed Conference

The views expressed here are those of the authors, and not necessarily those of the Bank of England or its committees.

### Motivation

- Inflation rates in the UK and other advanced economies increased sharply in 2021/22 before falling over 2023/24.
- Alongside the sharp increase in inflation rates, short-term inflation expectations also increased.
  - \* In August 2024, firms in the Decision Maker Panel (DMP) survey expected their own prices to increase by 3.4% over the next 12 months. Expectations for CPI inflation over the next year were 2.6%.
- This paper: How do monthly CPI inflation releases affect firms' inflation perceptions and expectations?
- A better understanding of expectation formation by businesses is important for monetary policymakers trying to bring inflation down, as well as for the large academic literature on expectation formation.

# Annual CPI inflation increased sharply in 2021/22 before falling in 2023/24

Notes: The series are three-month moving averages.

# 60% of firms consider CPI to be one of the top three most important factors for pricing decisions in 2023.

Notes: The figure is based on data collected between May and July 2023.

# Media coverage of inflation has closely tracked aggregate inflation trends

Notes: The series are three-month moving averages. 'Inflation media chatter' is calculated as the ratio of articles mentioning the words 'inflation'/CPI'/consumer price index' in UK newspapers scaled by the total number of articles published. The index is normalised to have an average value of 100 between 2010-2019.

### **Three Main Findings**

1. Firms are aware of aggregate inflation changes. A 1pp increase in CPI inflation  $\rightarrow$  0.7pp increase in CPI inflation perceptions of firms in the days (even hours!) following the release.

### **Three Main Findings**

- 1. Firms are aware of aggregate inflation changes. A 1pp increase in CPI inflation  $\rightarrow$  0.7pp increase in CPI inflation perceptions of firms in the days (even hours!) following the release.
- 2. There is a significant pass-through of CPI inflation changes to firms' *own*-price expectations over the next 12 months.
  - \* This effect is significant over 2022-2024, but absent in the 2017-2021 period. The effects are stronger for increases in headline CPI inflation.

### **Three Main Findings**

- 1. Firms are aware of aggregate inflation changes. A 1pp increase in CPI inflation  $\rightarrow$  0.7pp increase in CPI inflation perceptions of firms in the days (even hours!) following the release.
- 2. There is a significant pass-through of CPI inflation changes to firms' *own*-price expectations over the next 12 months.
  - \* This effect is significant over 2022-2024, but absent in the 2017-2021 period. The effects are stronger for increases in headline CPI inflation.

### 3. Mechanisms:

- \* Positive CPI inflation changes  $\rightarrow$  higher near-term CPI inflation expectations, lower expected volume growth, higher expected cost growth.
- \* Positive CPI inflation changes  $\rightarrow$  higher expected borrowing costs, consistent with an anticipated monetary policy response.
- \* Firm own-price expectations are more responsive to CPI releases when inflation media coverage is elevated.

### **Related Literature**

- High-frequency news: Gorodnichenko, Melnick, Kutai (2023); Binder (2021); Bottone and Rosalia (2019); Enders, Hunnekes, Muller (2019); Di Pace, Mangiante, Masolo (2023); Lamla and Vinogradov (2019); Rast (2021); Coibion, Gorodnichenko, Weber (2022); Lewis, Makridis, Mertens (2019)
  - \* **Contribution:** Firms respond to monthly CPI releases by changing their current CPI perceptions and own-price expectations.
- (In)-attention: Savignac, Gautier, Gorodnichenko, Coibion (2021), Weber et al. (2023); Candia, Coibion, Gorodnichenko (2021); Bracha and Tang (2022); Pfauti (2023); Cavallo, Cruces, Perez-Truglia (2018); Korenok, Munro, Chen (2022)
  - \* **Contribution:** The responsiveness to CPI outturns is stronger in a high-inflation environment and when inflation media coverage is higher.
- Subjective models: Macaulay (2022); McClure, Coibion, Gorodnichenko (2022); Candia, Coibion, Gorodnichenko (2021); Andre, Pizzinelli, Roth, Wohlfart (2022)
  - \* **Contribution:** Firms' responsiveness to CPI is consistent with a supply-side view of inflation over 2022-2024.

### Outline

### 2 Methodology

### 4 Conclusion

### **The Decision Maker Panel**

- Monthly online panel survey of UK businesses (5-10 minute survey).
- Mainly completed by CFOs/Finance Directors and CEOs of firms.
- Jointly organised by the Bank of England, University of Nottingham, and King's College London. Launched in late 2016.
- Surveys around 2,500 firms monthly, covering around 4% of UK employment.
  Figure
- We ask firms about recent developments and year-ahead expectations for sales, prices, employment, and investment.
- ► Firms are asked to provide a five-point distribution for year-ahead expectations → allows us to analyze the mean, standard deviation, and skewness of expectations at the *firm level*. • Screenshot
- The DMP has been used to study multiple policy issues, including Brexit, Covid-19, inflation, and the impact of higher interest rates.

### Realised and expected firm own-price growth

Firms in the DMP have a good sense about their annual price growth.

### Event study methodology

- To test the effects of a change in CPI inflation on firms' inflation perceptions and expectations, we focus on a balanced two-day window around each release date.
- For firm i in industry w, responding in month m on date j of the event window, we estimate the following specification:

$$Y_{i,w,m,j} = \alpha_w + \alpha_m + \sum_{j=-2}^{+2} \gamma_j + \sum_{k=-2}^{+2} \lambda_k \Delta CPI_m \times \mathbf{1}[Day = k] + \varepsilon_{i,m,j}$$

- \*  $\alpha_m$ : Month fixed effects;  $\alpha_w$ : Industry fixed effects;  $\gamma_j$ : Response window fixed effects. Standard errors  $\varepsilon_{i,m,j}$  clustered at the firm level.
- \*  $\lambda_k$ : Effects of CPI inflation release  $\Delta CPI_m$  on each date of the release window. k = -1 is the omitted category.
- This specification can be estimated at the daily or hourly frequency around CPI releases. • Alternative: DiD Specification • Example: May 2022

- Robustness to additional controls Table
- Effect on inflation uncertainty and inflation skewness Table
- Daily dataset Table

### Mechanisms

- Why might firms increase their own-price expectations in response to higher aggregate inflation?
- Several potential explanations:
  - \* CPI inflation increases could signal more inflation persistence.
  - \* Positive demand shock Prices and output move in same direction.
  - \* Negative supply shock Prices and output move in opposite direction.
- We can test these alternative hypotheses using data on firm expectations in the DMP: (1) CPI inflation expectations; (2) unit cost growth; (3) real sales growth; (4) expected interest rate on borrowing.
- In addition, firms may be more responsive to CPI outturns when media coverage of inflation is elevated, consistent with an (in)attention mechanism.

🕕 Data

### 2 Methodology

3 Results

### Conclusions

- This paper analyses how firms update their inflation perceptions and expectations in response to monthly CPI inflation releases.
- Firms pay attention to CPI inflation trends and update their current CPI perceptions within hours of the latest data release.
- Furthermore, firms update their own-price expectations in response to CPI releases. This effect is present in 2022-2024, but not in previous years. Firms also update short-term CPI expectations.
- Firms seem to interpret CPI changes over 2022-2024 as signals about the supply-side of the economy: Higher CPI leads to lower expected volume growth and higher expected cost growth.
- The response to CPI inflation changes is stronger in periods with more coverage of inflation in the media.

# Thank you!

### DMP survey example question: Expected own-price growth

### **Decision Maker Panel**

### **Decision Maker Panel**

Looking ahead, from now to 12 months from now, what approximate % change in your AVERAGE PRICE would you expect in each of the following scenarios?

#### Note:

Price growth scenarios should be ordered from the lowest to the highest.

The LOWEST % change in my prices would be about:

A LOW % change in my prices would be about:

A MIDDLE % change in my prices would be about:

A HIGH % change in my prices would be about:

The HIGHEST % change in my prices would be about

	2	96
	3	%
	4	%
	5	%
	8	96

Please assign a percentage likelihood (probability) to the % changes in your AVERAGE PRICES you entered (values should sum to 100%).

LOWEST: The likelihood of realising about 2% would be:	5 %
LOW: The likelihood of realising about 3% would be:	15 %
MIDDLE: The likelihood of realising about 4% would be:	25 %
HIGH: The likelihood of realising about 5% would be:	20 %
HIGHEST: The likelihood of realising about 8% would be:	35 %
Total	100 %

### DMP monthly response rate

### DMP matches UK industrial and regional spread

### Panel A: By Industry

### Panel B: By Region

### **Decision Maker Panel**

BANK OF ENGLAND

We would now like to ask you about your expectations for annual consumer price inflation in the UK economy as a whole.

As a percentage, what do you think is the current annual CPI inflation rate in the UK? And, what do you think the annual CPI inflation rate will be in the UK, both one year from now and three years from now?

Note: Consumer price inflation is the rate at which the prices of goods and services bought by households rise or fail. It is measured by the Consumer Prices Index (CPI). The annual inflation rate compares prices for the latest month with the same month a year ago.

Current rate of inflation Inflation one year from now Inflation three years from now

### Average number of responses in event window

### Alternative: Difference-in-differences methodology

- To test the effects of a change in CPI inflation on firms' own expected price growth, we focus on a balanced two-day window around each release date.
- For firm i in industry w, responding in month m on date j of the event window, we estimate the following specification:

$$Y_{i,w,m,j} = \alpha_w + \alpha_m + \sum_{j=-2}^{+2} \gamma_j + \lambda \Delta CPI_m \times Post_j + \varepsilon_{i,m,j}$$

- \*  $\alpha_m$ : Month fixed effects:  $\alpha_w$ : Industry fixed effects
- \*  $\gamma_i$ : Response window fixed effects.
- \*  $\lambda$ : Effects of CPI release  $\Delta CPI_m$  on expected inflation in the days following the release vs. prior.
- \* Standard errors  $\varepsilon_{i,m,j}$  clustered at the firm level.
- Extended event windows across months Further Details

### **Alternative: Extended event windows**

- One limitation of our methodology is that CPI releases usually occur on the second Wednesday of the (two-week) DMP survey window.
- As a result, there are only three days in the 'post' period in a given month (i.e. Wed, Thurs, Fri).
- One workaround for this is to build an extended event window around each CPI release which covers days across multiple waves.
- We operationalise this by building a panel of ±20 calendar days around each CPI release.
- Furthermore, we limit each window such that there is only 1 CPI release in it.
- This will allow us to analyse how firms update their expectations over a long horizon than two days.

#### Example: Current CPI inflation perceptions in May 2022

Note: On 18 May 2022, annual CPI inflation increased from 7% to 9%.

#### CPI releases vs. CPI news, 2018-2024

### CPI releases and CPI inflation perceptions: Daily event window

Firms update their perceptions of current CPI inflation immediately following the release date.
